Note.—This word appears in medical dictionaries as a subst. m. The Greek adjective ὀπισθότονος (here adopted, *literatim*) is also used substantively as a synonyme of ὀπισθοτονία, a convulsion of parts backwards; in the same manner, too, it means "a person labouring under that disease" (viz., ὀπισθοτονία); likewise, a bond, cord, or fetters by which the hands are bound behind the back; it is nevertheless still an adjective term. In modern pathological literature, it is properly to be regarded as retaining the quality of the Greek adjective, agreeing with *Tetanus*, subst. m., the name of a disease, the varieties of which it and other adjective terms, as *Completus, Emprosthotonos, Pleurothotonos*, etc., are necessarily employed to distinguish.
